

MODISH POLYTEK

We pride ourselves as one of the few factories that are doing it the Traditional way. Our UP Resin is not mixed with other substrates eg. calcium carbonate, etc, but are used in their original form - other than adding in colour pigments for in-mould colours. We **GUARANTEE** 100% Original UP Resin, not any other substitutes to create a look alike of Polyester Coated Boards. UP Resin in its original solid form carries all the advantages of being scratch, heat, water and chemical resistant. It is a light weight coating material that can withstand extreme changes in temperature without cracking.

Textures (gloss, matt, leather grain, square embossed, etc) can be simulated with its natural like effects in solid surface features made with unsaturated polyester resins. These products are advantageous over their natural counterparts in that they offer non porous surfaces which allow them to be used in hygienic environments like kitchens, hospitals and biological laboratories. Other markets for UP Resins include the caravan panel market and the material is widely used in storage vessels (where the chemical resistance of the material is highly valued).
